

```
1 How the process works:
2
3 THE esp32 is constantly running a game of tic tac toe waiting for the user 1 to hit a
  key on the matrix keypad, user 1 will click on 1 -9 that will corallate with the tic
  tac toe board
4
5 1|2|3
6  ---
7 4|5|6
8  ---
9 7|8|9
10
11 once the user clicks on a number the board will send a single to the broker to
  activate a daemon file that will wait 20 seconds, if the user clicks on any key, it
  will activate the human player script which will take the suer input (from 1-9 ) and
  send it to the broker which will send it to esp32
12 the esp32 check the input, if notvalid will keep asking till valid input provided
13 if no key press is detected the script.sh will run and will pick a random number from
  1-9 which will be sent to the esp32 that will check the input is valid, if its not it
  will keep asking till a valid input is provided
14
